

DEVELOPING A COMPREHENSIVE BUSINESS STRATEGY FOR EFFECTIVE BUSINESS GROWTH

BUSINESS DATA MANAGEMENT- CAPSTONE PROJECT

FINAL TERM REPORT BY:
GUNDAVARAPU PREETHIKA CHOWDARY
ROLLNO: 24F2002054

TABLE OF CONTENTS

CONTENTS	PAGE NO
1.EXECUTIVE SUMMARY	3 - 4
2.DETAILED EXPLANATION OF ANALYSIS PROCESS/METHOD	4 - 7
3.RESULTS/FINDINGS	8 - 14
4.INTERPRETATION OF RESULTS AND RECOMMENDATIONS	15 - 18

1.EXECUTIVE SUMMARY

This final-term report provides a comprehensive financial and operational analysis of Veeraih and Co., a cement dealership in Guntur, Andhra Pradesh. Established in 2024, the business operates with five employees and generates an annual income of ₹12 lakhs (estimated) as it is a new business which is producing an average income of 1 lakh rupees per month. The main problems faced by the business which were identified in conversation with the owner are:

The analysis revealed several critical insights:

- **High Transportation Costs:** Diesel vehicles cost ₹6–₹9/km, while electric vehicles (EVs) reduce this to ₹1–₹1.5/km, offering a realistic 10% savings after factoring practical constraints. Government subsidies (FAME II, AP EV policy) further lower adoption costs.
- **Credit/Debit Risks:** 60% of sales are on credit, with 20% facing payment delays of 30–45 days. Digital invoicing and reminders can reduce overdue volume by 15–30%.
- **Environmental Impact:** CSR initiatives like EV adoption and rooftop solar reduce pollution and energy costs, improving brand image and long-term savings.
- **Low Profitability due to Competition:** Seasonal sales trends suggest the need for better inventory and marketing planning. Profit margins vary with customer type (8% for retailers, 3% for wholesalers), indicating a focus on retail growth.
- **Labour Shortage:** Heavy cement bags create hiring challenges, suggesting the need for mechanization aids like trolleys or mini-cranes.

The data was collected and pre-processed by entering the data into the excel book manually. With the mid term submission the analysis of data is done using excel and its variety of tools like pivot table, charts and various formulas like mean, median, standard deviation, min, max.

In this final report, different charts were used to visualize the data and also the interpretation of the findings is done here.

The detailed explanation of analysis process/ methods section explains analysis methods that were used in the analyzing the data starting from the collection of data and pre-processing of the data. Data was collected using a time series analysis framework over eight months (August 2024 to March 2025), allowing monthly trend analysis. Three analytical methods guided the process:

Descriptive Analysis: Answering “what happened?” using summary statistics and visualization to clarify sales patterns, customer distribution, and operational metrics.

Diagnostic Analysis: Exploring “why did it happen?” to identify root causes for cost overruns, inconsistent profitability, and operational bottlenecks. **Trend Analysis:** Tracking monthly variations and identifying seasonal peaks or declines in sales to inform inventory and marketing strategies. All these analysis methods were clearly explained in this section. No formal written or digital records existed initially. Data was collected through detailed interviews with the owner and entered manually into Excel. The collected data has been

structured. This structured dataset enabled the generation of descriptive statistics (min, max, mean, mode) and clear visualizations (line and column charts) to support decision-making.

Results and Findings section explains the final results obtained from the analysis and visualisation of the data has also been done in this section. In this section the obtained answers from the analysis for all the problems mentioned are explained in detailed manner. This section summarizes what analysis revealed about the dealership's specific problems.

Interpretation tells the reader what those observations mean in context. Interpretation of results section explains outcomes of the analysis.

In recommendations section some recommendations were provided in order to reduce the loss and increase the profitability of the firm.

2.DETAILED EXPLANATION OF ANALYSIS PROCESS/METHODS :

Introduction:

The data has been collected using time series analysis technique since the data has been collected over a regular intervals for a period of 8 months from august 2024 to march 2025.

There are mainly 3 types of analysis methods for analyzing the data, that is

1. Descriptive Analysis
2. Diagnostic Analysis
3. Trend Analysis

Descriptive analysis helps to answer the question "what happened?". It provides statistical summary to understand what is happening with the data. On the other hand Diagnostic Analysis focuses on why something has happened. Trend analysis helps to identify the consistent patterns over time and helped to understand how key business metrics are evolving month by month.

Objective:

The objective of this project, titled "Developing a Comprehensive Business Strategy for

Effective Business Growth," is to analyze and resolve the key operational and financial Challenges faced by Veeraih and Co., a new cement dealership in Guntur,Andhra Pradesh.

This dealership is struggling with:

- High transportation and logistics costs.
- Environmental issues due to cement dust (as part of csr activity).
- Low profitability because of intense market competition.

The ultimate goal is to enhance business profitability, optimize financial and operational performance for sustainable growth.

From the discussion with the owner, it was found that the 80 percent of the customers are retailers and other 20 percent of the customers were builders and sub contractors and also the profit margin from the retailers is 8 percent and wholesalers is 3 percent. On the basis of this analysis, to increase the profitability the retail customers has to be increased.

Pre-Processing of data:

As mentioned earlier in mid term report,

There was no written or digital storage of data, the only means to collect the data is from the

Discussion with the owner, and write it manually into excel, pivot table is created and all the required analysis is performed.

For example, daily sales data is available but I wanted monthly summaries for the analysis so the data was grouped and summed by month to create a monthly sales report. The revenue data was on papers and had to be entered into excel for further data processing.

Pivot table is created using the cleaned data (data that has been processed to remove errors, inconsistencies, or irrelevant information, making it accurate, reliable, and ready for analysis) and also the type of customer (retailer or wholesaler) is analysed while cleaning the data, this helped to analyse the data in order to increase the profitability as the profit from the retail customer is 8 percent and profit from the wholesale customer is 3 percent.

1.Descriptive analysis:

With the help of the excel, different formulas were used to get the summary statistics of the data which was extremely helpful in analysing the data. Similarly different charts were used in order to understand the data more precisely, that is line charts, column charts, etc have been used in later sections. Line charts were used to analyse the trends across the months of the year. column charts were extremely useful in showing data changes over period of time and for illustrating comparisons. the descriptive statistics were calculated using excel formulas like min, max, mean and mode. These formulas were applied to each column and descriptive statistics is generated for the entire dataset.

Specific objectives of descriptive analysis:

- Understand the business performance
- This analysis helps to analyse profit margins and monthly earnings.

Chart link:

https://docs.google.com/spreadsheets/d/1xYAZieWnIN99h2GnafxJQEfzXOskaT5yH_g4HWdOZGc/edit?usp=sharing

2. Diagnostic analysis and Trend analysis:

Since the main goal was to decrease the loss due to above mentioned problems, these analysis methods are used to check the overstocking during the off season months, the trends across the months are helpful to find the seasonal months. The monthly sales chart helped to understand which months of the year has the most no of sales and which months of the year has low sales. As explained in the Mid term report, the diagnostic analysis helped to analyze the root causes behind some patterns and deviations caused in the dataset, they are,

1. The inconsistent profit margins despite the fixed selling price,
2. Overproduction during the off season,
3. Profit not correlated with high sales.

This analysis helped to investigate the causes behind patterns and deviations found in the data.

For instance,

1. Inconsistent Profit Margins Despite Fixed Selling Price

Data Observation: Selling price per bag is fixed (₹310), yet monthly profits vary from ₹80,000 to ₹1,10,000.

Diagnosis:

Monthly variations in bags sold (from 9,200 to 11,200) cause changes in total revenue. Operational and transportation costs fluctuate due to inefficient production planning and seasonal variations.

Root Cause: Lack of cost control and overproduction during low demand months.

2. Overproduction During Off-Season

Data Observation: Sales are lowest in August and September, but stock levels and production remain high (up to 10,000+ bags).

Diagnosis:

Business continues full-scale production despite reduced sales.

Stock before sales peaks (up to 1800 bags), which is inefficient use of capital and storage.

Root Cause: No demand forecasting or seasonal adjustment to production planning.

3. Profit Not Correlated with High Sales

Data Observation: High sales months (e.g., Nov–Jan) don't always yield highest profits.

Diagnosis:

Even with more revenue, higher operational or transportation costs offset profits.

Example: November has high sales, but profit isn't highest due to likely increased transport or labor costs.

Root Cause: No cost optimization during peak demand — possibly paying premiums on labor, fuel, or logistics

Chart link :

https://docs.google.com/spreadsheets/d/1eO_xutN8_6t5Rs8UZ6ruDBqJCfDVvgic249m85au_Kk/edit?usp=sharing

This analysis helped to focus on identifying consistent patterns over time and helped to understand how key business metrics are evolving month by month. For instance, Sales range from 9200 to 11200 bags/month. One month showed spike (high sales) and other dips aligning with typical seasonal trends (as shown in excel the months with high sales is November, December and January and low sales is August and September). The best season for cement sales in India— October to February, this is mainly because these months have dry weather and are ideal for construction. Government infrastructure projects and private real estate activities usually increase since cooler temperatures are more favourable for large-scale cement work (concrete setting is better in moderate climate).

MONTH	BAGS SOLD
Aug-24	9200
Sep-24	9500
Oct-24	10,000
Nov-24	10000
Dec-24	11200
Jan-25	10800
Feb-25	10300
Mar-25	9800

https://docs.google.com/spreadsheets/d/1xYAZieWnIN99h2GnafxJQEfzXOskaT5yH_g4HWdOZGc/edit?usp=sharing

3. RESULTS AND FINDINGS

Starting with the main problems of the business, here are some results and findings for each problem mentioned in the objective,
Starting with the 1st problem,

1. HIGH TRANSPORTATION COSTS, CREDIT AND DEBIT RISKS

High transportation costs can be reduced using Electric vehicles and also using of Google maps for shorter routes also helps a bit. Also the government provides subsidy for buying electric vehicles which adds to the profit of the firm.

For a diesel vehicle the approx cost per km is around ₹6 – ₹9/km and this includes ₹90/litre diesel, low mileage (3–5 km/L) whereas on the other hand electric vehicles costs around (3-wheeler or mini van) ₹1 – ₹1.5/km and this includes Based on ₹6–7/unit electricity, EVs give 8–10 km/unit

Even though per km cost saving is huge (up to 80%), realistically, businesses experience net savings of 10–20% after considering some factors like limited trip conversion, initial electric vehicle investment, mixed fleet usage etc. So, for your cement dealership, a 10% reduction in transport cost is a realistic and conservative estimate to use in financial analysis.

CHART 1: DECREASE IN COSTS AFTER SWITCHING TO EV

Moving on to the subsidy from government, as per central and state government policies, here are some schemes from the government

Central Government – FAME II Scheme

FAME II (Faster Adoption and Manufacturing of Hybrid and Electric Vehicles) is the central subsidy scheme.

For electric 3-wheelers and 4-wheelers (cargo):

Subsidy = ₹10,000 per kWh of battery capacity. Maximum subsidy = up to ₹1.5 lakh per vehicle (for commercial use)

Andhra Pradesh State-Level Subsidy State EV policy (2020–2025) includes:

100% exemption from road tax and registration fees and interest subsidy of up to 30% for commercial EV buyers. Infrastructure support for charging stations. Additional ₹10,000–₹20,000 rebate possible via state programs.

Credit and Debit risks

What Are Credit and Debit Risks?

Credit risk: Customers purchase cement on credit (buy now, pay later), and may delay or default on payments.

Debit risk: If the business continues to operate with outstanding customer payments, it creates liabilities, reduces cash in hand, and affects your ability to purchase new stock or pay suppliers.

With the discussion with the owner it is found that the 60 percent of the clients (especially the contractors) purchase on the credit basis and 20 percent of the clients delay the payment by 30 to 45 days, for this repeated follow ups were required and no digital or legal documentation was in place. These delays in payments caused stock purchase delays, loss in early purchase discounts and also the dependency on personal loans or overdrafts.

Some strategies to reduce credit and debit risks is to :

1. Use digital invoices and payment reminders

How it helps is to generate an invoice instantly using mobile apps or WhatsApp templates and it sends automatic payment due reminders (1-2 days before the due date, on due date, and post due date), it builds professionalism and builds accountability

Tools that can be used for this are

WhatsApp business, Vyapar app, Khatabook, OkCredit

A 2023 case study published by Vyapar reported that small traders in Andhra Pradesh using invoice + reminder automation tools saw:

Reduction in overdue credit volume by ~20–30% within 2 billing cycles. Improved on-time payment rate from 52% to 67% in 60 days.

Khatabook's 2022 SME Impact Report mentions:

On average, local businesses recovered ₹7,000–₹10,000 faster per month after switching to digital reminders. 1 in 4 users reduced their average credit cycle by 5–10 days. All these suggest that the reduction in credit and debit risks by at least 15 to 20 percent.

2. Partial Advance Payments

Ask for 50 percent advance before dispatch, especially for new customers or large orders, this helps to reduce total risks and filters out high-risk customers. This can be applied to new customers or irregular ones and also when the orders are above 10000 rupees.

3. Customer Segmentation Based on Risk

Classify the customers into Low Risk, Medium Risk, and High Risk. Allows the dealership to tailor payment policies accordingly. Maintain a logbook or Excel sheet tracking payment history. Give a 15-day credit to Low Risk clients. 7-day credit to Medium Risk. Advance only for High Risk.

Chart 2: EXPECTED REDUCTION IN COSTS AFTER USING ABOVE MENTIONED TECHNIQUES

2.ENVIRONMENTAL CONCERNS AS PART OF CSR ACTIVITY

What is CSR?

CSR is a business model in which companies integrate social and environmental concerns into their operations and interactions with stakeholders. It means a company goes beyond profit-making and takes responsibility for its impact on society and the environment.

Usage of electric vehicles helps in cutting down the costs as explained above and also reduces environmental pollution and also switching to Solar Power for Dealership Operations and installing rooftop solar panels on warehouse or office can offset electricity usage for lights, CCTV, billing systems. This creates an impact to get reduced electricity bill and clean power use.

Month	Diesel Cost (₹)	EV Cost (₹)	Savings (₹)	% Decrease
Aug-24	₹92,000	₹83,379.60	₹8,620.40	9.37%
Sep-24	₹95,000	₹85,547.50	₹9,452.50	9.95%
Oct-24	₹1,00,000	₹90,270.00	₹9,730.00	9.73%
Nov-24	₹1,00,000	₹90,400.00	₹9,600.00	9.60%
Dec-24	₹1,12,000	₹1,01,740.80	₹10,259.20	9.16%
Jan-25	₹1,08,000	₹98,107.20	₹9,892.80	9.16%
Feb-25	₹1,03,000	₹93,668.20	₹9,331.80	9.06%
Mar-25	₹98,000	₹88,327.40	₹9,672.60	9.87%

Chart 3: COSTS OF TRANSPORTATION BEFORE AND AFTER USING EV'S

Encouraging bulk orders can reduce number of deliveries, fuel use and emissions, this problem involves in considering the whole cement industry but considering this problem also benefits the firm by using the electric vehicles, solar power and at the same time fulfilling the social responsibilities.

3.TO IMPROVE NON-PROFITABILITY DUE TO LARGE COMPETITION

There is huge competition in cement dealership business and also thin profit margins, in order to increase the profit margins the following analysis has been done and results have been found to increase the profit.

The insights drawn from the analysis of the data,

CHART 4: NO OF BAGS SOLD VS MONTH OF THE YEAR

The chart above shows the monthly sales of cement bags for an interval of 8 months. This helps to understand if there is any trend in sales (i.e. if there is any seasonal demand for the stock). This analysis helps to prevent overstocking or stockouts which helps to reduce wastage in production cost (which is part of operational cost). From the chart above we can see that the sales were high in the months from October to February (Post monsoon months & winter) as they are ideal months for construction. The government projects usually ramp up and real estate demand spikes. The peak months were November, December, January. The months where the demand is low, as seen from the above chart 1 is August, September. Usually construction slows down due to rain and flooding. Transportation issues also delay supply in these months.

Now checking on the relation between the no of bags sold and profit, this analysis helps to check if profit is related to no of bags sold or not.

CHART 5: BAGS SOLD WITH THE PROFIT

The above chart 5 is created to find out if there is any relation between the sales volume and the profit. From the chart 4, the peak months were found to be November, December, January but from chart 5, the profit is high in the months November, August, March. So, from both chart 4, chart 5 it can be inferred that the months with high sales is not related to the months with high profits. Even when there is high sales volume, there is no high profit that is because of high transportation cost or high operational costs in that particular month. To reduce high transportation costs, the business can start using electric vehicles, which would cut down the costs drastically by 10 percent and additionally the government would provide subsidy on purchasing and registering the electric vehicle. The government subsidy adds profit to the business.

Some ways of increasing retail customers to increase profitability:

Also other way to increase profitability is to increase retail buyers more than wholesale buyers since the profit for wholesale buyers is 3 percent whereas for retail buyers its 8 percent. Some ways of doing so is to tie-up with Masons and Contractors, they influence retail buyers. Offering them a small incentive/commission to refer customers to you. Keeping enough stock of popular brands and grades. Offering bulk discounts. Giving loyalty discounts to repeat customers. Stock multiple cement brands. Also keep related items: sand, bricks, steel rods, tiles. Many retail buyers want one-stop shopping. Offer Bundle products (cement + sand + bricks if possible). These activities can help to attract retail customers.

4.LABOUR SHORTAGE

In discussion with the owner, it was found that due to the high weight of cement bags there was a shortage in labour.

CHART 6: NO OF BAGS SOLD VS OPERATIONAL COSTS

The above scatter plot (chart 6) shows the relation between the operational cost and bags sold. As seen above the operational cost is increasing linearly with the no of bags sold. There are likely few fixed costs but most expenses like raw materials, labour, packaging etc increases as the production increases. Some ways to reduce the operational costs with increasing production is to use machinery instead of man power to reduce labour wages and errors, as the labour shortage is also one of the major problems faced by the business. Increase market reach by registering in online sites like IndiaMART, TradeIndia, Udaan and other sites. These sites help the owner to reach bulk buyers across India or even globally. Also verified listing on trusted platforms increases buyer confidence.

4. INTERPRETATION OF RESULTS AND RECOMMENDATIONS

After reviewing the analysis and findings, the report can be wrapped up with the proposed solutions and recommendations aimed at propelling the business towards progress and benefit. The analysis conducted on the key problem areas of the cement dealership has yielded insightful results that not only highlight existing inefficiencies but also provide measurable improvements through strategic interventions.

1. High Transportation Costs and Credit/Debit Risks

Transportation Cost Interpretation

Switching from diesel to electric vehicles offers a realistic 10% cost saving, considering practical challenges like limited fleet usage and initial investment. This reduction significantly improves the net margins in a low-margin business like cement retail, especially for high-frequency local deliveries. Route optimization using Google Maps can provide incremental efficiency gains, particularly in urban or semi-urban areas with variable traffic patterns.

Conclusion: EV adoption, while requiring upfront investment, leads to tangible cost savings and aligns with both profit and sustainability goals.

Credit and Debit Risk Interpretation

A majority (60%) of credit-based transactions and delayed payments (30–45 days by 20% of clients) create cash flow bottlenecks, hampering daily operations and stock replenishment. Introducing digital invoicing, reminders, and segmentation policies has shown a 15–30% improvement in credit recovery based on similar business case studies (Vyapar, Khatabook). Partial advance payments and risk-based customer segmentation provide better control over working capital and reduce dependency on external financing. **Conclusion:** Digital financial tools and structured payment policies can significantly reduce payment delays, improve liquidity, and enhance financial discipline in operations.

2. Environmental Concerns and CSR Activities

Addressing environmental issues as part of Corporate Social Responsibility (CSR) reflects a company's commitment to sustainable development and ethical business practices. By actively working to reduce their environmental impact, firms demonstrate accountability not only to shareholders but to the broader community and future generations. EV usage and solar power not only reduce costs but also contribute to lowering the dealership's carbon footprint, supporting environmental sustainability. These CSR-aligned initiatives also improve brand image and open up future opportunities for green business certifications or partnerships with eco-conscious clients. Bulk order encouragement reduces delivery frequency, cutting down on emissions and increasing per-trip profitability.

Conclusion: CSR actions like green energy adoption not only fulfill environmental responsibilities but also contribute to long-term cost savings and reputational benefits.

3. Low Profitability Due to High Competition

Seasonal analysis shows profitability peaks during specific months, allowing the business to plan inventory and marketing efforts more effectively. Operational cost analysis reveals that small but targeted actions—like reduced delivery frequency, EV use, and solar panels—can improve net profit margins, even in a competitive market. The analysis of monthly cement bag sales over eight months reveals important seasonal trends that can guide inventory and operational planning. The data shows that sales consistently peak during the post-monsoon and winter months—October to February—with November, December, and January being the highest. This pattern aligns with increased construction activity during dry, cooler weather, when government infrastructure projects and real estate demand typically accelerate. Recognizing this seasonal demand helps the business avoid overstocking in low-demand months and stockouts during peak periods, optimizing working capital and reducing production waste—a key part of controlling operational costs.

Conversely, sales drop in August and September, when monsoon rains disrupt construction schedules and complicate transportation. This highlights the need for careful inventory management and contingency planning for supply chain delays during the rainy season.

However, examining profit trends in chart 4 reveals that sales volume does not always translate to higher profit. While sales peak in November, December, and January, profit is highest in November, August, and March. This suggests that high operational and transportation costs in certain months can erode profit margins, even when sales are strong. For example, expensive fuel and logistical challenges may offset gains from higher sales.

To address this, adopting electric vehicles for transportation is recommended. Electric vehicles can reduce transportation costs by about 10%, while also qualifying for government subsidies that further improve profitability. Such measures not only lower expenses but also support sustainability goals, strengthening the business's competitive position and long-term resilience.

And also the above mentioned suggestions in results and findings section helps to increase the retail customers suggest that increasing retail customers for a cement dealership depends on improving visibility, service quality, pricing strategy, and local partnerships. The proposed strategies focus on making the business more accessible, competitive, and customer-friendly.

Conclusion: Smart operational planning aligned with seasonal demand and strategic cost control can make the dealership more resilient in a highly competitive market. The usage of suggestions mentioned can also help to increase retail customers to increase profitability.

4. LABOUR SHORTAGE

The shortage is primarily due to the physical difficulty of handling 50kg cement bags. This affects loading/unloading and overall logistics efficiency. Introducing mechanical handling aids like trolleys or mini-cranes and using a flexible labour model during peak times can address this issue. The scatter plot (chart 6) illustrates a clear linear relationship between operational cost and the number of cement bags sold, indicating that costs rise steadily with increased production. While some portion of operational expenses remains fixed—such as rent or basic utilities—most costs are variable and scale with output. This includes raw materials, packaging, and especially labor costs, which grow proportionally as more bags are produced and sold.

One notable challenge highlighted is labor shortage, which not only limits production capacity but can also drive up wages and reduce operational efficiency due to errors or inconsistent work quality. To address this, investing in machinery and automation can help streamline production, reducing reliance on manual labor. This can lower wage expenses, improve consistency, and boost overall productivity. Additionally, automation can mitigate errors and rework costs, further driving down operational expenses in the long term.

Beyond production efficiencies, expanding market reach is critical for maintaining sales volumes and margins. Registering the business on online B2B platforms like IndiaMART, TradeIndia, and Udaan enables the owner to access a broader customer base, including bulk buyers across India and potentially international markets. Verified listings on these platforms build buyer confidence and can lead to higher-volume, repeat orders, supporting steady cash flow. By improving operational efficiency and expanding market access simultaneously, the business can better manage costs while growing sales sustainably, ensuring stronger profitability even as production scales up.

Conclusion: Labour issues can be mitigated with simple mechanization and strategic manpower planning, improving workflow and reducing reliance on a shrinking labour pool.

OVERALL INTERPRETATION

The results clearly show that a multi-faceted approach—involving cost reduction (EV, solar), financial discipline (credit control), operational planning, and environmental accountability—can significantly improve both profitability and sustainability of the cement dealership. Strategic adoption of digital tools and government schemes, when combined with customer behaviour insights and internal process improvements, leads to measurable business impact across financial, operational, and social dimensions.

RECOMMENDATIONS

Based on the results and their interpretation, the following recommendations are made to enhance profitability, operational efficiency, and sustainability of the cement dealership:

1. Adopt Electric Vehicles (EVs) for local deliveries. Begin with one 3-wheeler or mini electric van to evaluate savings and performance. Utilize government schemes (FAME II and AP State Subsidy) to reduce the initial cost.
2. Train drivers to use Google Maps or install GPS-based fleet tracking apps to reduce distance and fuel use and schedule bulk deliveries to reduce the number of trips.
3. Use Digital Tools (Vyapar, Khatabook, OkCredit, WhatsApp Business) and generate digital invoices and send automatic payment reminders. Keep track of customer credit history digitally.
4. Set Credit Terms Based on Customer Segmentation:
Low Risk: 15 days credit
Medium Risk: 7 days credit
High Risk: 50% advance or no credit
5. Collect Partial Advance Payments.(Especially for new or irregular clients and large orders (₹10,000+))
6. Install Rooftop Solar Panels and use solar energy to power billing systems, lighting, and CCTV. Apply for any available state subsidies on solar installation.
7. Increase retail customers using above mentioned suggestions in results section.
8. Encourage Bulk Orders and offer small incentives (discount or priority delivery) to clients who place large orders to reduce trip frequency.
9. Create a CSR Statement by Communicating your green practices (EVs, solar, reduced emissions) on customer bills, shop banners, or WhatsApp status.
10. Stock up and market aggressively before peak seasons (e.g., post-monsoon construction surge) and keep track of fuel, maintenance, and staff costs monthly using Excel or budgeting apps. Minimize unnecessary trips and optimize delivery frequency.
11. Replace labour with machinery so that it helps with the labour shortage problem and reduces operational costs.
